# EE463 – DC Motor Driver Term Project Presentation
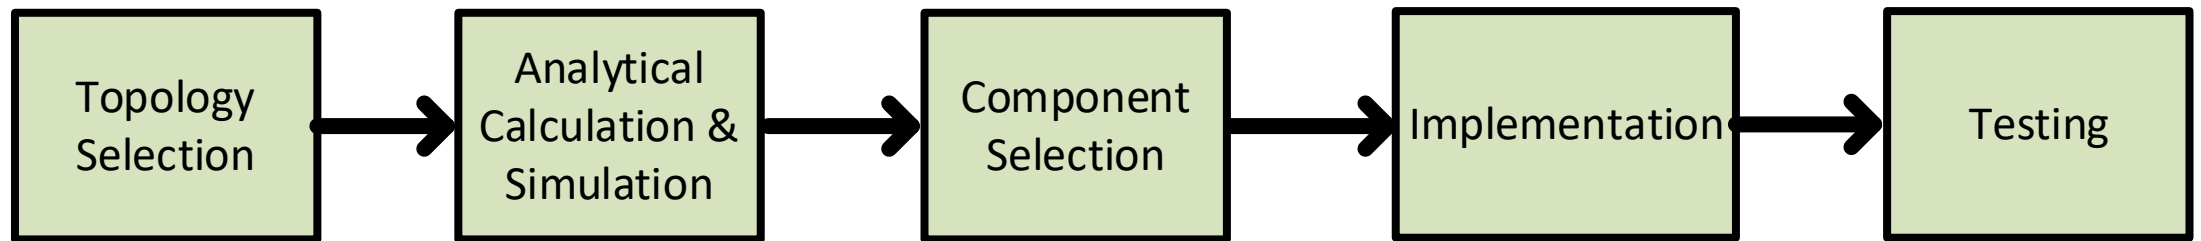

Project Specifications

- AC/DC converter

- Three-phase or single phase

- Adjustable output voltage up to 180 V
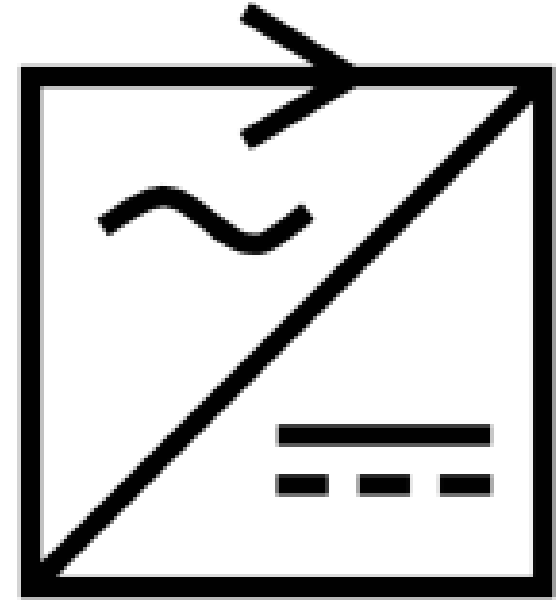

- Drive the motor from standstill

What to do?

| Topology Selection | → | Analytical Calculation & Simulation | → | Component Selection | → | Implementation | → | Testing |

Topology Selection

- Diode Rectifier + Buck Converter

- Three-phase Thyristor Rectifier

- You can choose other topologies if you want

Analytical Calculation & Simulation

- From simple to complex
- Try to simplify and verify fundamental blocks
- Start with ideal case

Analytical Calculation & Simulation

- Include component parameters after component selection
- Include parasitics such as series inductances at switching components
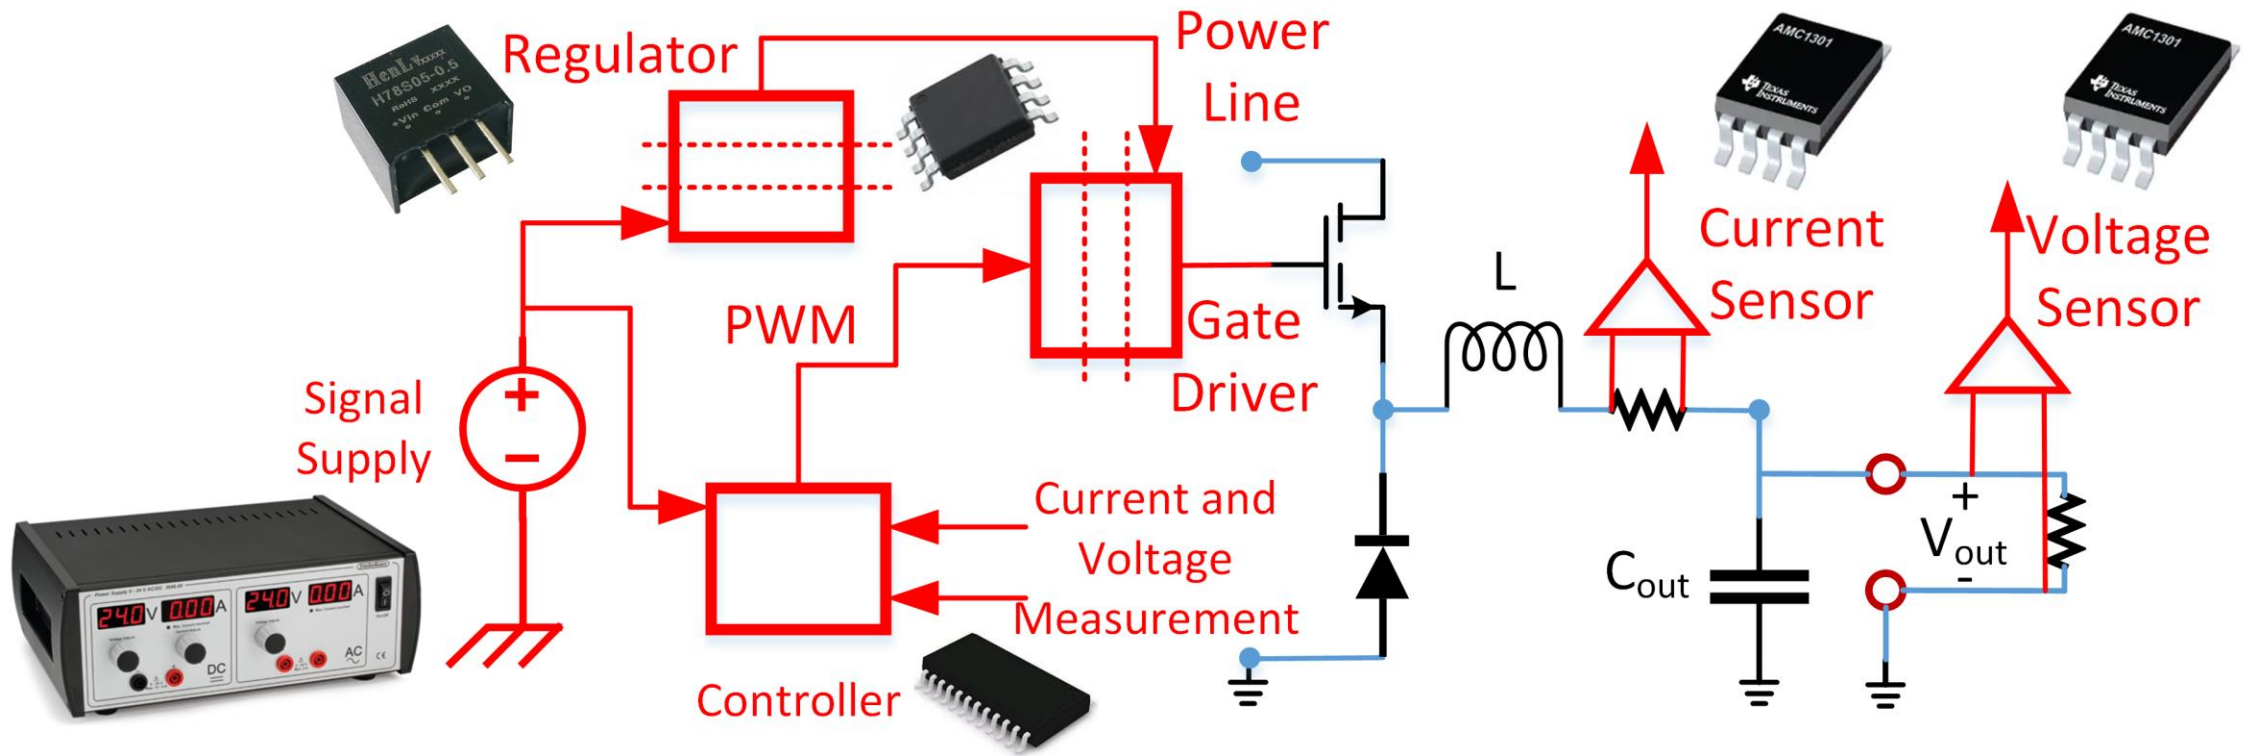

Component Selection

Ideal World

- MOSFET & Diodes
- Capacitor & Inductor

Real World

- MOSFET & Diodes
- Gate drivers
- Regulators
- Magnetic core & wires
- Electrolytic, ceramic... capacitors
- Controllers
- Isolators
- Current & voltage sensors
- Connectors
- Heatsinks & Fans

Component Selection

Component Selection

- Choose a controller
- Can be analog or digital
- You can use TL494 or other analog controllers
- You can use 555 timer to create PWM
- Check other controller ICs
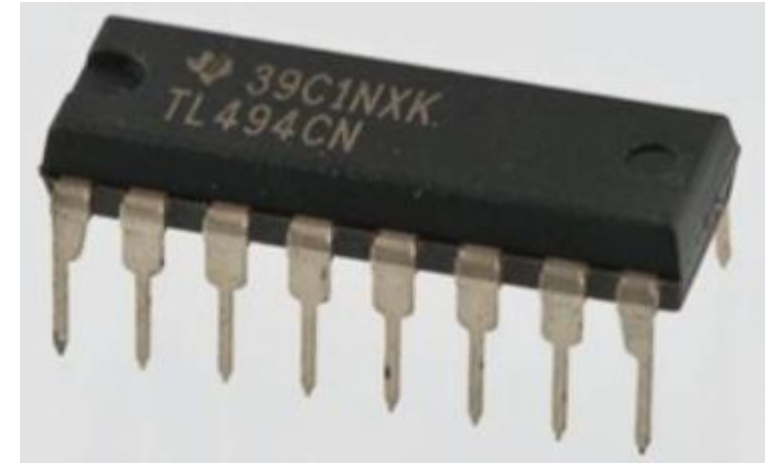

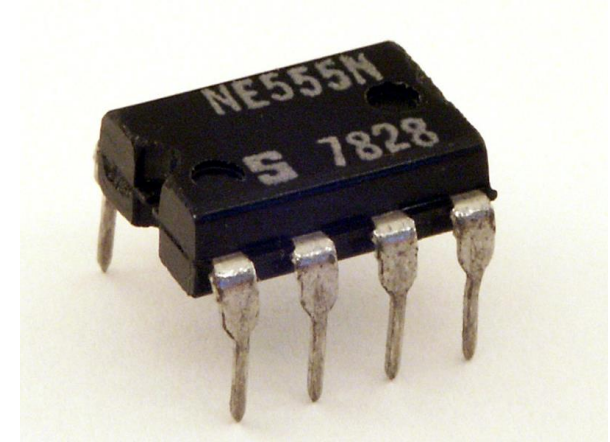

Component Selection

- Choose a switching frequency
- Higher the frequency, smaller the circuit
- Increases switching loss and AC losses of cables
- fs<100 kHz

500 kHz	1 MHz
MSS1260-103	MSS7341-502
PCB area = 144 mm2	PCB area = 53 mm2
Volume = 864 mm3	Volume = 217 mm3

Component Selection

- Choose components according results
- Calculate the voltage, current, and thermal stresses on critical components and try to give some safety margin
- Check the available component list
- Use Digikey (Ekom Elektrik), direnc.net, ozdisan.com
- Or visit Yıldırım Elektronik, Ser Elektronik, Konya Sokak
- May require some iterations
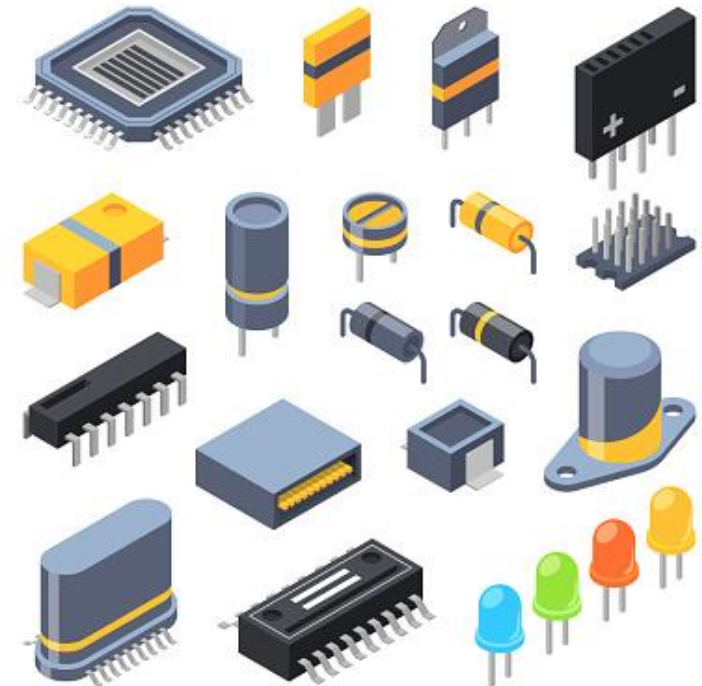

Component Selection

- Calculate the switching and conduction losses for semiconductors

- Use datasheets to find thermal resistances

- Calculate junction temperatures of ICs

- If necessary add a heatsink or fan to your design
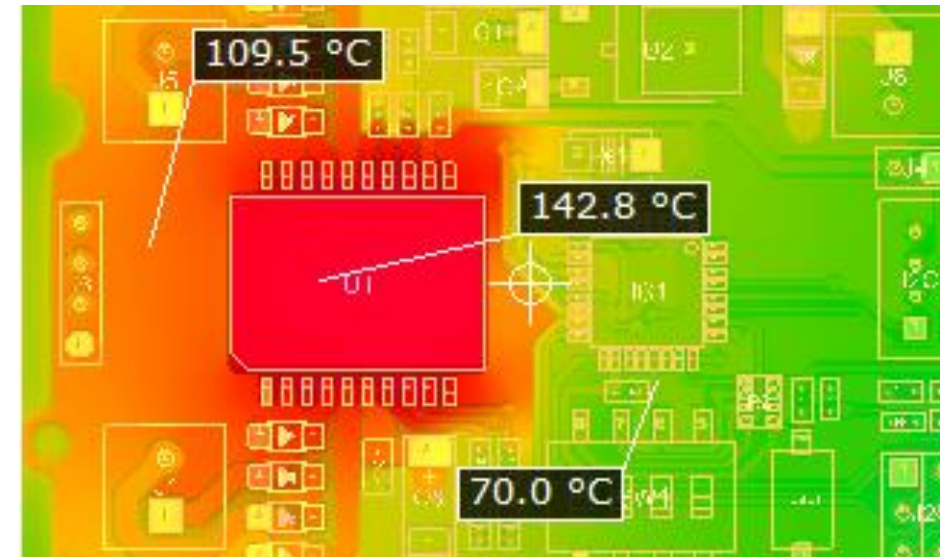

Implementation

- Do not use breadboard for final design

- Can use stripboard but make sure connections are neat and rigid

- Can use connectors for ICs

- PCB is more professional, robust, and compact. (Also bonus)
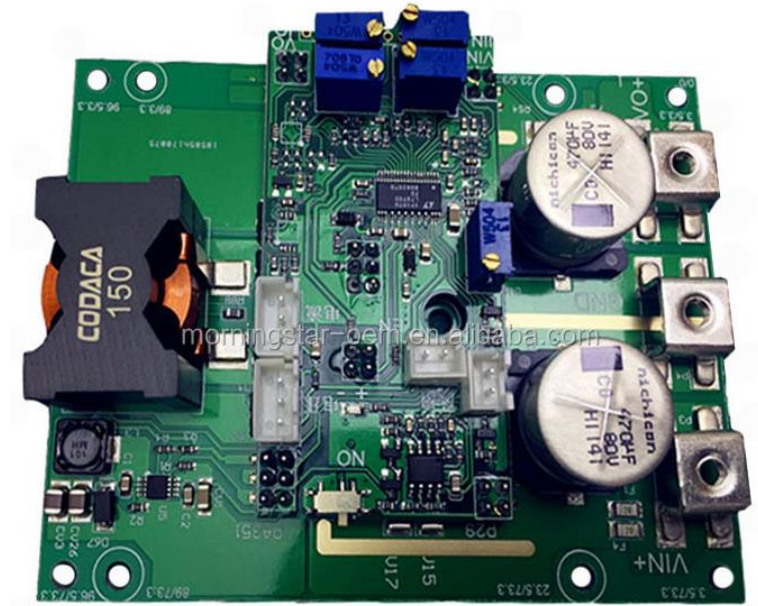

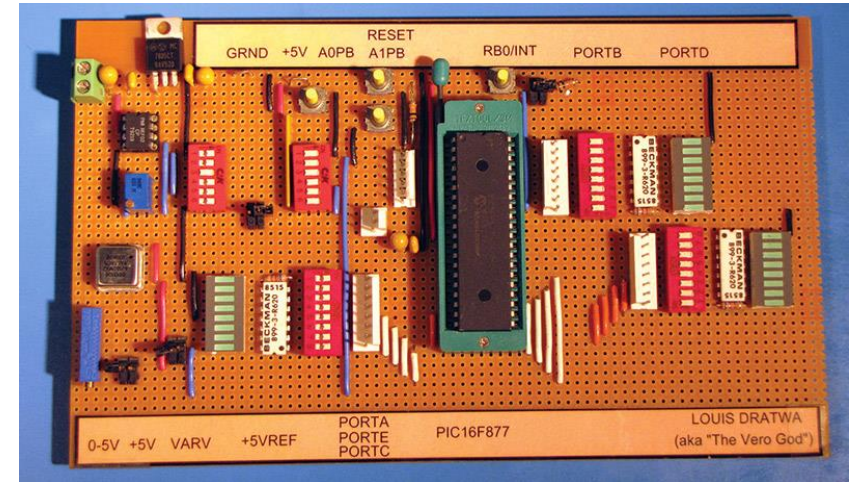

Implementation

- Keep the gate path of the switches short and wide

- Keep power path wide

- Use fuses at the input side of the circuit

- Use optocouplers like TLP250 or other isolators between control stage and power stage

- Keep the design neat and compact to encounter fewer problems

- Use provided connectors for safe and easy tests

- Plan ahead and create spaces for the testing points

Lab Usage

- You can use the lab during work hours when there is no experiment.

- Book a slot at "*Lab Scheduler*" on Odtuclass.

- Put the equipment and cables back to its place after you are done.

- If you want to use available components, add the amount and the name of the component to [this list](#).

- Do not take any equipment out of the lab.

Tuesday, November 16, 2021	08:30	09:30	furkan tokgoz	Yes	Book slot
	09:30	10:30	furkan tokgoz	Yes	Book slot
	10:30	11:30	furkan tokgoz	Yes	Book slot
	11:30	12:30	furkan tokgoz	Yes	Book slot
	12:30	13:30	furkan tokgoz	Yes	Book slot
	13:30	14:30	furkan tokgoz	Yes	Book slot
	14:30	15:30	furkan tokgoz	Yes	Book slot
	15:30	16:30	furkan tokgoz	Yes	Book slot
	16:30	17:30	furkan tokgoz	Yes	Book slot

Testing

- Be careful
- Do not touch the live circuit
- Capacitor can hold charge for long time
- Make sure that variac is zero
- Start with resistive load at lower frequencies and voltages
- Increase the stress on circuit step by step

Bonuses

- **Cheapest Design:** To design with the cheapest unit cost.
- **Efficiency:** To design with the highest efficiency under rated load.
- **Compactness:** To design with the smallest volume.
- **Industrial Design:** To design/s with a proper enclosure and labels.
- **Tea:** To design/s that can boil water at kettle.
- **PCB:** To design/s with PCB implementation.
- **Single Supply:** To design/s which uses single supply to feed all circuitry.
- **Analog Controller:** To design/s with analog controller.
- **Four-Quadrant:** To design/s with four quadrant drive capability.
- **Closed Loop:** To design/s with closed loop voltage or current control.
- **Best Video:** To the most creative and fun video/s.
- **Karma:** To the person who helps the most.

Deadlines

- **Deciding Group Members and Creating Github Repo:**
19th of November
- **Simulation Report and Presentation for Feedback Session**
2nd of January
- **Final Demo**
21st of January
- **Final Report**
6th of February
- **Video**
6th of February

Imagination

Reality

Topology Selection → Analytical Calculation & Simulation → Component Selection → Implementation → Testing
